
theta x_θ
gamma x_γ
A Weak coupling, $g_{vv} = 0.5$ (detrended MI 0.00)
1 s expansion
gamma Hilbert envelope
B Representative point, $g_{vv} = 8.2$ (detrended MI 0.20)
1 s expansion
gamma Hilbert envelope
C Excessive coupling, $g_{vv} = 50 \approx 2.4\,g^*$ (leaves the range at 1.21 s)
last 1 s before leaving the range
gamma amplitude (absolute, log scale)
numerical range 10^{30}
$g_{vv} = 8.2$ (row B)
$g_{vv} = 50$
scaled position
envelope / max
gamma amplitude r
time (s)
D Growth of a small gamma perturbation along 20 stochastic theta paths
$g_{vv} = 8.2$: mean slope λ_1 = -0.51 s^{-1}
$g_{vv} = 30$ ($\approx 1.5\,g^*$): mean slope λ_1 = +20.06 s^{-1}
baseline decay $-G_{\gamma,0}t/2$
$\ln \|\delta u(t)\|$
